

SubRosaSoft's MacLockPick II™

SubRosaSoft MacLockPick™ is an indispensable tool designed for first responders and law enforcement professionals performing live forensic triage on most computer systems. The solution is based on a USB Flash drive that is inserted into a suspect's computer that is running. Once the MacLockPick II software is run it will extract the requisite data providing the examiner fast access to the suspect's critical information, that may otherwise be rendered unreadable by modern encryption programs, hardware malfunctions, or simply powering the system down. MacLockPick II is the only cross platform solution on the market and therefore the best chance of successfully capturing data critical to any investigation involving running computers. In addition, MacLockPick II is minimally evasive, providing results that can hold up in a court of law.

MacLockPick II is designed to capture information that might be considered valuable to an IT manager, an E-Discovery professional, or a digital forensics law enforcement officer. Such information includes details about the system, activities of the user of that system, and the online history of that user.

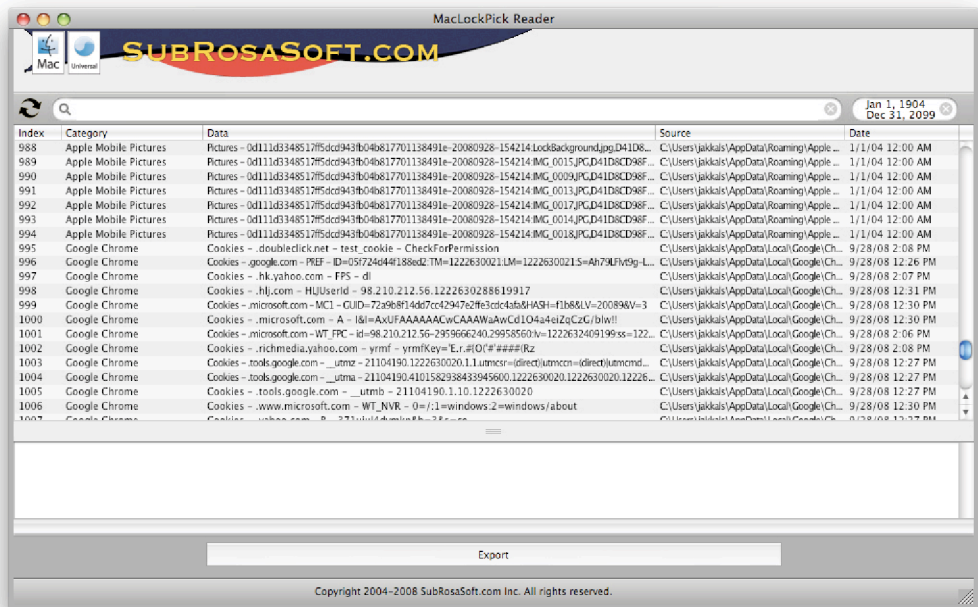

A database of the suspect's information is compiled on the Flash Drive to allow for easy transportation away from the suspect's system. This database can be read by the included log readers on Microsoft Windows, Linux, or Apple Mac OS X computers back at base.

MacLockPick also includes log reader tools that can be used to access your suspect's data. MacLockPick functions in a forensically safe manner and will never write to the disk or device being investigated. Instead MacLockPick simply extracts and saves the data to its own flash drive or a pre-configured alternative device.

Through the use of a plug-in architecture MacLockPick II can be configured to collect almost any kind of information depending on the needs of the investigator. This information might include files of a specific type, chat logs, phone records, browser history, passwords, accounts, and system state data.

Ideal for conducting on-scene triage and clandestine or covert operations.

For more detailed information on MacLockPick II, please visit the website for the product on <http://www.MacForensicsLab.com>.

Pricing: \$499.95 for Private Industry. Federal, State, and Local law enforcement professionals can purchase MacLockPick II for \$399.95.

System Requirements:

- Mac OS X 10.3 or higher
- Windows XP and Vista
